SENTIMENT ANALYSIS (OPINION MINING)

Definition from Google:

noun

the process of computationally identifying and categorizing opinions expressed in a piece of text, especially in order to determine whether the writer's attitude towards a particular topic, product, etc. is positive, negative, or neutral.

"companies have key lessons to learn about harnessing the power of social media and sentiment analysis"

♦ MICRO-BLOGS

Definition from Google:

noun

a social media site to which a user makes short, frequent posts.
"she announced her retirement on her microblog, bidding farewell to the sport"

Examples: Twitter, Youtube Comments, Ecommerce Reviews, Article Comments etc

Problem Statement

STATEMENT

"A basic ingredient of **Sentiment Analysis** that uses Bag-of-words approach is an Opinion Lexicon containing words/phrases along with their positivity and negativity ratings. Many methods have been suggested for building such a lexicon. In this thesis a method **utilizing micro-blogs** (user comments from Facebook pages) is suggested. While, this lexicon will be **domain specific**, it will be a **first in the Nepalese context** and can lay the foundation for development of Sentiment Analysis resources. Major **challenges** are that data generated by users on the Internet is subject to informal language. Also misspellings, abbreviations, emoticons and multi-language content pose additional hurdles. The benefits are that micro-blogs are richer in subjective content compared to text found in formally written sources. The thesis will investigate the use existing lexicons (such as emoticon lexicon) and manually generated lexicons as seed lexicon for enriching and expanding them.." – Text from Report

Objectives

- Develop a method of generating opinion lexicon using text available in microblogs
- Refine the strategy for filtering out mistakes and useless terms from the microblog lexicon
- Generate an opinion lexicon for Nepali, specify its pros and cons.

Literature Review

❖ Two Prevalent methods

Dictionary Based

- Uses word relations in dictionaries (like WordNet [3])
- Eg. SentiWordNet [1]

Corpus Based

- Analyses occurrences of words in documents
- Mostly uses Pointwise Mutual Information between words.
 Eg: [5]

Literature Review

PRIMARY REFERENCE

Paper: Detecting Sentiment in Nepali Texts [2]

- Translation of SentiWordNet words to Nepali (Bhavanakos)
- Sentiment Clue List
- Nepali Sentiment Corpus

LIMITATIONS

- Translated from English Lexicon
- Not representative of language used in Microblogs
- Absence of Polarity Strengths

Literature Review

♦ OTHER INSPIRATIONAL PAPERS

Paper: Sentiment of Emojis [4]

Polarity strengths for various Emojis

Paper: Sentiment lexicon generation for an underresourced language [5]

- Selects top patterns in text
- Uses Pointwise Mutual Information between words

ASSUMPTIONS

- Bag of Words
- Neutral words occur in both positive and negative contexts
- Positive words occur more with other positive words
- Negative words occur more with other negative words

Conclusion

PROS

- Suitable for microblog domain
- Small number of pre-requisites
- Captures colloquial language features

CONS

- Micro-blog domain dependent
- Unable to distinguish POS
- Difficult to test

Conclusion

ACHIEVEMENTS

- Micro-blog domain specific lexicon
- Strategies for refining were studied
- Around 4000 terms could be produced from a simple seed lexicon

FURTHER WORK

- Increasing data size can improve accuracy and precision
- Build a domain independent lexicon using WordNet of digital dictionary
